

A couple of things here:

Within the white wall dashboard, when I go to Clients and I go to Clients with account, I only see four people pop up: myself, Andrew, Haley, and Madison.

Whenever I go to Bookings and I look at Recently Booked, we just had a booking today from a woman named Lauren Smith. If she successfully booked, that would mean that she had to have created an account, right, or is that not the case?

Is it possible for people to book a session with us and not create an account? If so, that would explain why our clients with accounts don't include Lauren.

If that's not the case, then Lauren should be included in the clients with accounts, right?

Here's what the data shows.

****Lauren Smith is in the database as a client**** — record created 2026-07-01, email l.davis9954@gmail.com, for a Taylor's Mill "Two Hours" session on 2026-07-18, booked through the `custom-flow` booking flow. So her booking went through fine and a client record was created for her.

****But booking a session does not require creating a login account.**** The client table holds a contact record for everyone who books (1,254 people). Every booking automatically creates/attaches a client record from the info entered at checkout — that's a contact, not a portal login. There's no "account" flag stored on the client record (Lauren's `properties` is empty, and no client in the table carries a has-account field). So the "Clients with account" list you see (you, Andrew, Haley, Madison) is coming from the account/login system, which is separate from the booking contact list.

So to your questions:

- ****Can someone book without an account?**** Yes. Lauren is the proof — she has a booking and a client contact record but no login account.
- ****Should Lauren show under "Clients with account"?**** No — booking doesn't create an account, so she correctly appears in your general client list but not in "Clients with account."

One caveat: the "has an account" distinction isn't stored in this database, so I can only confirm the booking/contact side. I can't independently reproduce the 4-person "Clients with account" list from the data I have.
